

1. Color differentiation of black and brown interior plastic components

Black and brown interior plastic parts should be color differentiated. For this purpose, a color measurement sensor type **SPECTRO-3-28-45°/0°-MSM-ANA-DL** is used. At this, the distance from the sensor to the interior parts is approximately 28mm and the detecting range of the sensor in around 15mm in diameter at this distance. The plastic parts can be proper differentiated as shown in the screenshots.
